

PURE DISTINCTION

CREEPING BENTGRASS

DELTA BLUEGRASS COMPANY

NOW OFFERING

PURE DISTINCTION

CREEPING BENTGRASS

Pure Distinction is the ultimate bentgrass for smooth and true putting greens. Pure Distinction boasts a rich heritage that includes the legendary Penn A's and G's. Pure Distinction features dense, upright and aggressive growth with an exceptional ability to compete against Poa-annua.

Benefits of Pure Distinction Include:

- Quick recovery
- Resistance to heat and cold
- Wear tolerance
- Bold, distinctive color
- Resistance to bacterial wilt, brown patch and more
- High tolerance to Poa-annua herbicides

SOD IS GROWN ON USGA SAND
LIMITED QUANTITIES AVAILABLE

MANAGEMENT PRACTICES THAT HAVE PROVEN SUCCESSFUL ON **CREEPING BENTGRASS**

PURE DISTINCTION CREEPING BENTGRASS

MAINTENANCE PROGRAM

Tee-2-Green creeping bentgrass varieties are tough and hearty requiring less water and fertilizer than other creeping bentgrass varieties, typically resulting in an easier management regimen for the superintendent. Properly maintained, they provide a very high-quality playing surface that thrives on low mowing and results in excellent playability.

In general, the amount of fertilizer applied should be .1 lbs. of nitrogen per 1,000 sq. ft. every 14 days +/-, depending on approximate growth, clippings, and performance. The yearly amount of nitrogen will be from 2 to 4 lbs., phosphorous 2 to 3 lbs., and potassium 6 to 10 lbs. As far as micronutrient amounts, this should be checked via tissue tests during the growing season and again with a soil test in early spring.

Fertilization

After the turfgrass has grown in, fertilizer applications should be kept light and infrequent, and can be accomplished by the use of a fertigation system or a soluble product. Only irrigate when necessary. To fill the soil profile to field capacity or to flush salts from the soil profile, stretch the time between irrigation cycles as long as possible. This will vary according to the time of year, but it is possible to go up to 10 days or longer, only hitting hot spots if required.

Aeration

Aeration needs will vary from course to course based on soil type, traffic and growing conditions. Most golf courses aerate two to three times a year – typically in the spring, early summer, and fall.

Topdressing

Topdressing varies depending on management style, ranging from light, weekly applications to once a month when verticutting. As with all bentgrass get as much topdressing into the playing surface as possible by opening up the canopy using groomers, verticutting, grooving, or spiking.

DELTA BLUEGRASS COMPANY GOLF TURF SERVICES:

- Soil Reliever Aeration
- Tee Top Laser Grading
- Top Dressing Greens & Fairways
- Tee & Green Repairs
- Koro Fraise Mowing and Turf Removal
- Large Area Verticutting
- Big Roll Installation
